Figure it out!

Alexander H. Sandtorv, Fredrik Edén (ill.)

Photosynthesis for Babies *The little genius*

All life depends on what is produced in photosynthesis. It is a process where plants capture light energy and store it as energy. Water and carbon dioxide from the air and soil are converted into carbohydrates that are used and stored, and oxygen is released into the air. Understand the vital task of plants from a baby's perspective, through a book you can read together with a 1-year-old!

Alexander H. Sandtorv, Fredrik Edén (ill.)

Alexander H. Sandtorv has a PhD in chemistry from the University of Bergen and has several years of experience as a researcher and lecturer.

Fredrik Edén is a trained illustrator from Middlesex University, and he has worked in commercial illustration and illustrated several books for many different publishers.
